

# **Rocketing Ahead: Leveraging Data Science in the New Space Age**

Kyriakos Fotiou

Nov 2023

# OUTLINE

---

- Executive Summary
- Introduction
- Methodology
- Results
- Discussion
- Conclusion
- Appendix

# EXECUTIVE SUMMARY

- Acquired SpaceX datasets through a data collection API and web scrapping.
- Employed exploratory data analysis techniques to analyse and visualise the acquired data.
- Utilising the Grid Search method to identify the most effective Machine Learning Model for predicting the classification of future landings.

Total Success Launches by Site

# INTRODUCTION

---

Given SpaceX's ability to reuse the first stage, the Falcon 9 rocket launches at a cost of **62** million dollars, significantly lower than the often-higher cost of up to **165** million dollars for rockets from other providers.

Therefore, by accurately predicting the successful landing of the first stage, we can estimate the cost of a launch. This predictive capability holds value for potential competitors bidding against SpaceX for rocket launches.

Key Questions:

1. Can historical launch data help predict the success of a new launch based on the first stage's landing outcome?
2. Is there a discernible choice that maximises the likelihood of a successful launch based on historical data analysis?

# METHODOLOGY

# METHODOLOGY

---

- Data collection methodology:
  - SpaceX REST API
  - Web Scraping (Wikipedia)
- Perform data wrangling:
  - Generate landing Class from Outcome column
- Perform exploratory data analysis (EDA) using visualization and SQL.
- Perform interactive visual analytics using Folium and Plotly Dash.
- Perform predictive analysis using classification models.
  - Using GridSearchCV to find best fit model

# Data Collection

# Data Wrangling

- **My Notebook**

[https://github.com/FotiouK/SpaceX\\_Data\\_Science/blob/main/3-jupyter-spacex-data-wrangling.ipynb](https://github.com/FotiouK/SpaceX_Data_Science/blob/main/3-jupyter-spacex-data-wrangling.ipynb)

- Refine the raw data by creating a new landing classification column based on the original outcome labels. This column will serve as our target for predicting landing success, denoted as:

- 1 for success
- 0 for failure

Original Outcome

True ASDS	None None
True RTLS	False ASDS
True Ocean	False Ocean
None ASDS	False RTLS

Landing Class

1	0
1	0
1	0
0	0

# EDA with Data Visualisation

- My Visualization Notebook

## Scatter Plot

Acquire relationship between variables,  
Flight Number vs. Orbit type  
Payload vs. Orbit type  
Flight Number vs. Payload Mass  
Flight Number vs. Launch Site

## Bar Plot

Plot success rate of each orbit

## Line Chart

Acquire yearly average launch success trend

# EDA with SQL

- My SQL Notebook

[https://github.com/FotiouK/SpaceX\\_Data\\_Science/blob/main/4-jupyter-labs-eda-sql-coursera/sqlite.ipynb](https://github.com/FotiouK/SpaceX_Data_Science/blob/main/4-jupyter-labs-eda-sql-coursera/sqlite.ipynb)

```
%sql select distinct Launch_Site from SPACEXTBL
```

- ✓ Query the names of the **unique launch sites** in the space mission
- ✓ Query the names of the **booster\_versions** which have carried the maximum payload mass.
- ✓ List the total number of **successful** and **failure** mission outcomes
- ✓ List the names of the boosters which have **success in drone ship** and have **payload mass** in some range
- ✓ Rank the count of successful **landing\_outcomes** in date range in descending order.

Launch_Site	Booster_Version
CCAFS LC-40	F9 FT B1022
VAFB SLC-4E	F9 FT B1026
KSC LC-39A	F9 FT B1021.2
CCAFS SLC-40	F9 FT B1031.2

Landing_Outcome	landings
No attempt	10
Success (drone ship)	5
Failure (drone ship)	5
Success (ground pad)	3
Controlled (ocean)	3
Uncontrolled (ocean)	2
Failure (parachute)	2
Precluded (drone ship)	1

# Interactive Map with Folium

- Add **Circles** for Launch sites and **Markers** for labels
- Add **MarkerCluster** for successful and failed launches
- Add **Lines** for calculate distance between launch sites and their proximities

- **My SQL Notebook**

[https://github.com/FotiouK/SpaceX\\_Data\\_Science/blob/main/6-jupyter\\_launch\\_site\\_location\\_folium.ipynb](https://github.com/FotiouK/SpaceX_Data_Science/blob/main/6-jupyter_launch_site_location_folium.ipynb)

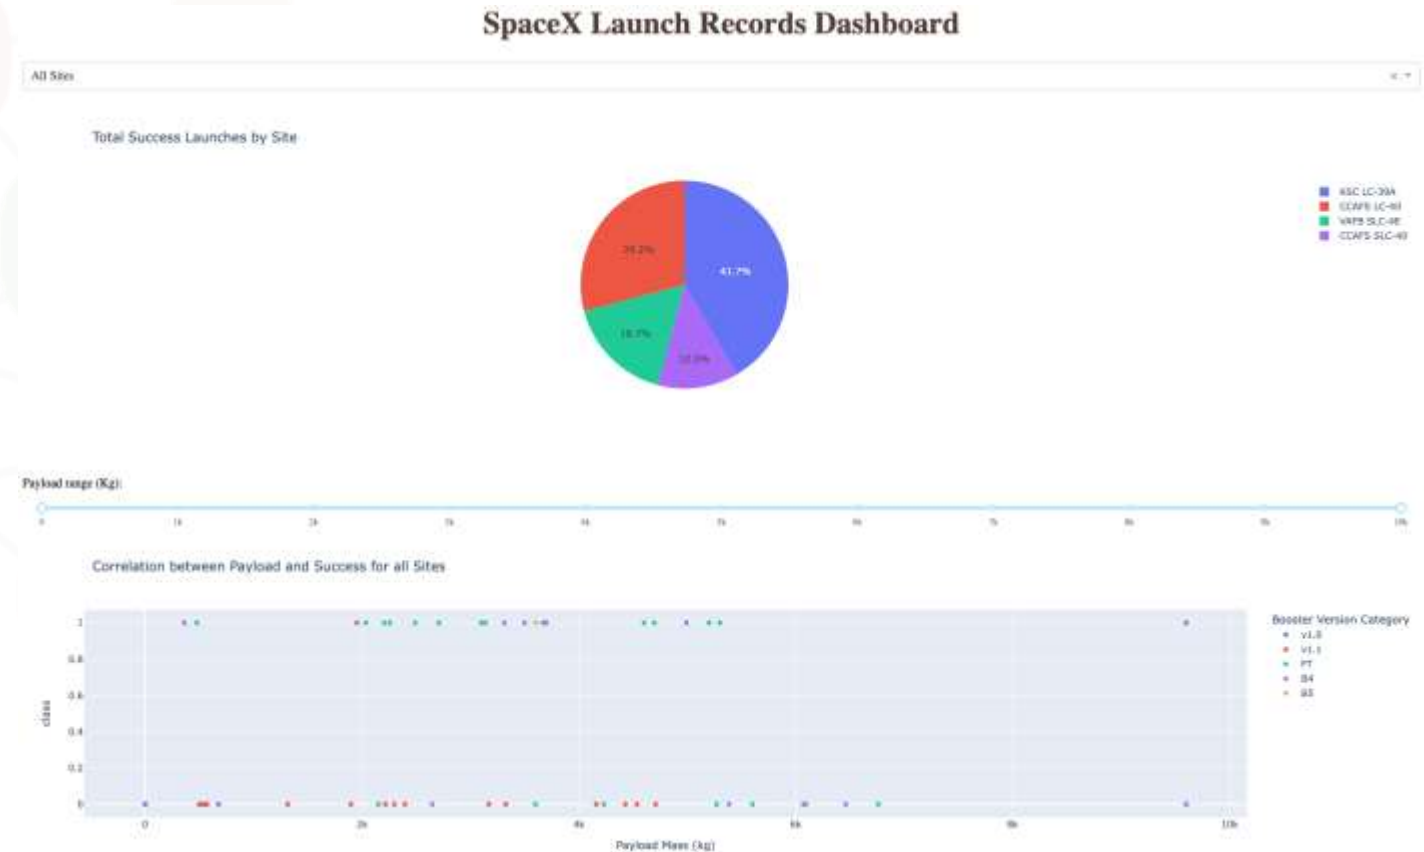

# Build Dashboard with Plotly Dash

- **Dropdown menu + Pie Chart:**  
Visualises success launch distribution per launch site.
- **Range Slider + Scatter Plot:**  
Analyses Payload vs. Success correlation across diverse launch sites.

- **My SQL Notebook**

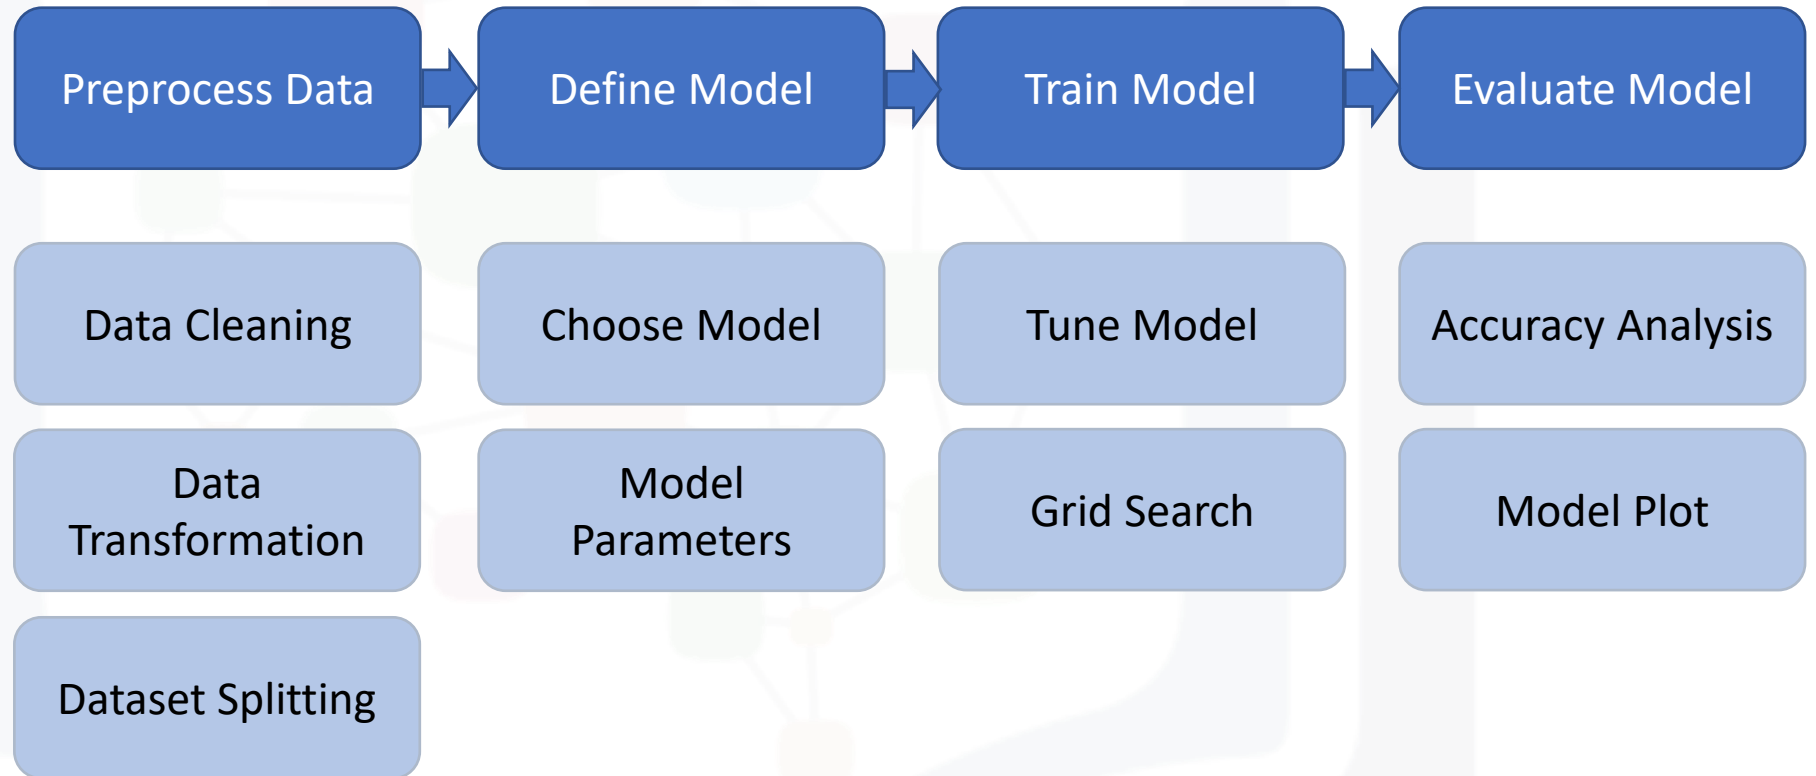

[https://github.com/FotiouK/SpaceX\\_Data\\_Science/blob/main/7-spacex\\_dash\\_app.py.ipynb](https://github.com/FotiouK/SpaceX_Data_Science/blob/main/7-spacex_dash_app.py.ipynb)

# Predictive Analysis(Classification)

- ☐ Prepare data
- ☐ Create a column for the class
- ☐ Standardize the data
- ☐ Split into training data and test data
- ☐ Define model and parameters
- ☐ Train and Grid Search for best parameters
- ☐ Evaluation

My Notebook

[https://github.com/FotiouK/SpaceX\\_Data\\_Science/blob/main/8-SpaceX\\_Machine\\_Learning\\_Prediction.ipynb](https://github.com/FotiouK/SpaceX_Data_Science/blob/main/8-SpaceX_Machine_Learning_Prediction.ipynb)

# RESULTS

## SpaceX Launch Records Dashboard

# INSIGHT DRAWN FROM EDA

# Flight Number VS Launch Site

```
In [39]: # Plot a scatter point chart with x axis to be Flight Number and y axis to be the launch site, and hue to be the class value
sns.catplot(y="LaunchSite", x="FlightNumber", hue="Class", data=df, aspect = 5)
plt.xlabel("Flight Number",fontsize=20)
plt.ylabel("LaunchSite",fontsize=20)
plt.show()
```

**Explanation:** The scatter plot demonstrates a correlation between the flight number and successful first stage landings. As the flight number increases, there is a noticeable increase in successful landings. Initially, launches are more frequent at the CCAFS SLC 40 site with a comparatively lower success rate. However, fewer launches occur at the VAFB SLC 4E and KSC LC 39A sites, where a higher success rate is observed.

# Payload VS Launch Site

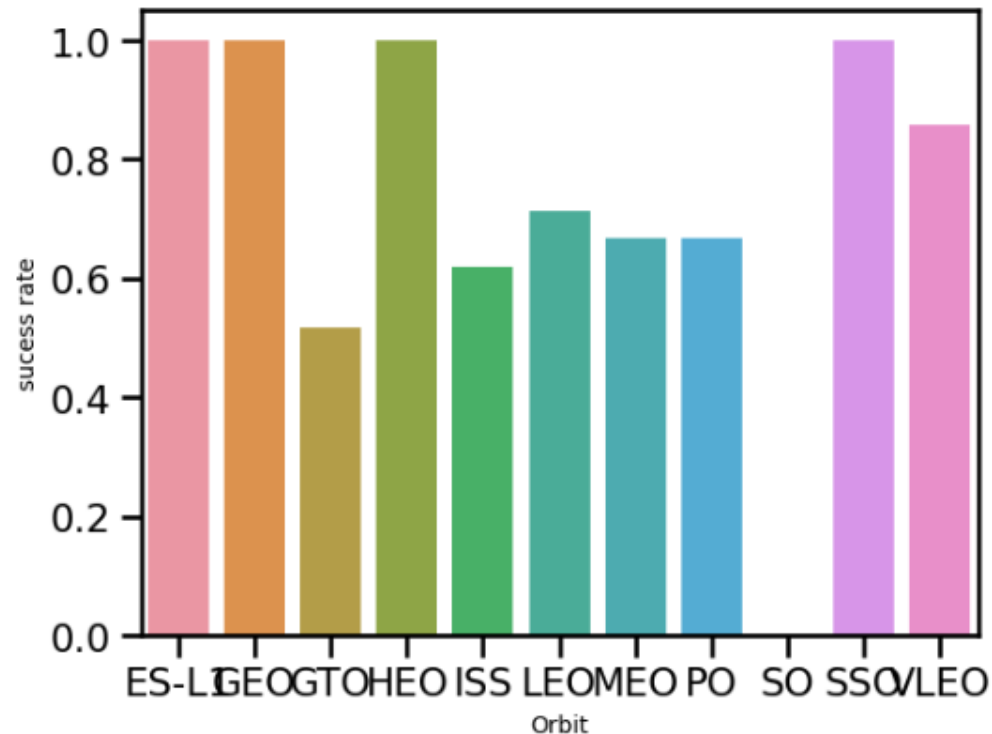

```
In [40]: # Plot a scatter point chart with x axis to be Pay Load Mass (kg) and y axis to be the Launch site, and hue to be the class value
sns.catplot(y="LaunchSite", x="PayloadMass", hue="Class", data=df, aspect = 5)
plt.xlabel("PayloadMass",fontsize=20)
plt.ylabel("LaunchSite",fontsize=20)
plt.show()
```

**Explanation:** The success rate significantly increases with a higher payload. Specifically, at the KSC LC39A launch site, there's a notably higher success rate associated with lower payloads compared to a substantially lower success rate at the CCAFS SLC 40 launch site. Additionally, there have been no rockets launched at the VAFB-SLC site for payloads exceeding 10000. Furthermore, there is an observed very high success rate overall for payloads greater than 9500.

# Success Rate VS Orbit Type

```
In [43]: sns.barplot(y='Class', x='Orbit', data=df_success_rate)
plt.xlabel("Orbit",fontsize=10)
plt.ylabel("sucess rate",fontsize=10)
plt.show()
```

**Explanation:** The bar plot clearly indicates that Orbit types ES-L1, GEO, HEO, and SSO exhibit the highest success rate, all reaching 100%. Conversely, within the SO orbit type, the success rate is recorded as zero.

# Flight Number VS Orbit Type

```
In [44]: # Plot a scatter point chart with x axis to be FlightNumber and y axis to be the Orbit, and hue to be the class value
sns.catplot(y="Orbit", x="FlightNumber", hue="Class", data=df, aspect = 3)
plt.xlabel("FlightNumber", fontsize=20)
plt.ylabel("Orbit", fontsize=20)
plt.show()
```

**Explanation:** In the ES-L1, GEO, HEO, and SSO orbits, every launch has resulted in a successful mission. Notably, there is a discernible correlation between the flight number and success rate in the LEO orbit, where an increase in flight number coincides with a rise in the success rate. However, this clear relationship is absent in the GTO orbit, where no obvious pattern between flight number and success rate can be observed.

# Payload VS Orbit Type

```
In [45]: # Plot a scatter point chart with x axis to be Payload and y axis to be the Orbit, and hue to be the class value
sns.catplot(y="Orbit", x="PayloadMass", hue="Class", data=df, aspect = 3)
plt.xlabel("PayloadMass",fontsize=20)
plt.ylabel("Orbit",fontsize=20)
plt.show()
```

**Explanation:** For missions carrying heavy payloads, there is a higher frequency of successful or positive landings observed in the Polar, LEO, and ISS orbits.

# Launch Success Yearly Trend

```
In [55]: # Plot a line chart with x axis to be the extracted year and y axis to be the success rate
sns.lineplot(y='Class', x='Date', data=df)
plt.xlabel("Date",fontsize=15)
plt.ylabel("Success rate",fontsize=15)
plt.xticks(rotation=45)
plt.show()
```

**Explanation:** The success rate, observed from 2013 through 2020, shows a consistent upward trend, steadily increasing over this period.

# All Launch Site Names

## Four Launch Sites:

- CCAFS LC-40
- VAFB SLC-4E
- KSC LC-39A
- CCAFS SLC-40

## 1 in western coast

- VAFB SLC-4E

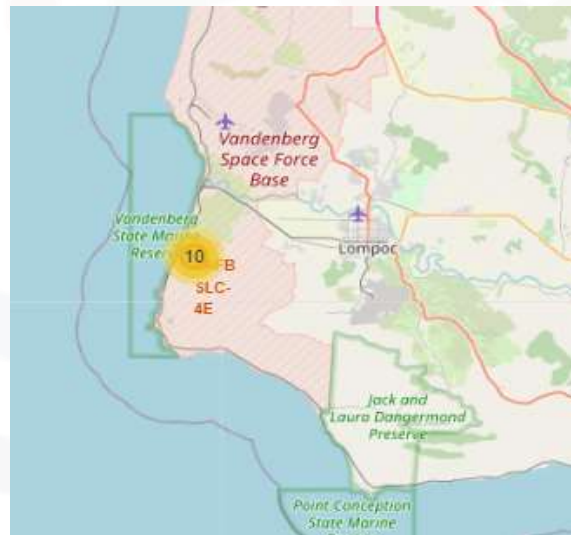

## 3 in eastern coast

Precluded (drone ship)	1

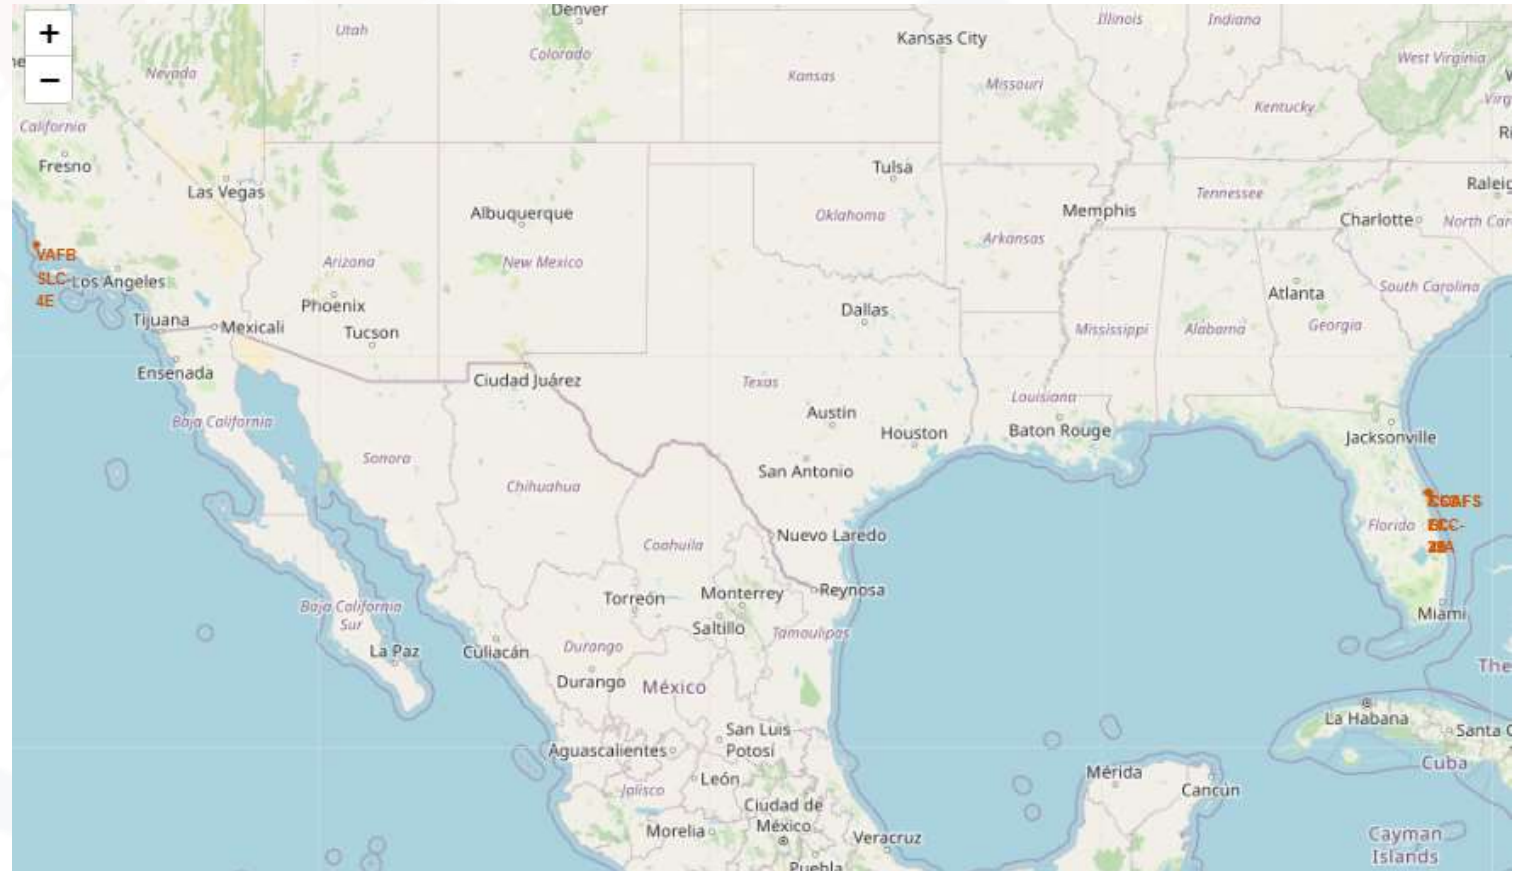

# LAUNCH SITES PROXIMITY ANALYSIS

# Locations of Launch Sites on Maps

- Three in the east
- One in the **west**
- All in the south

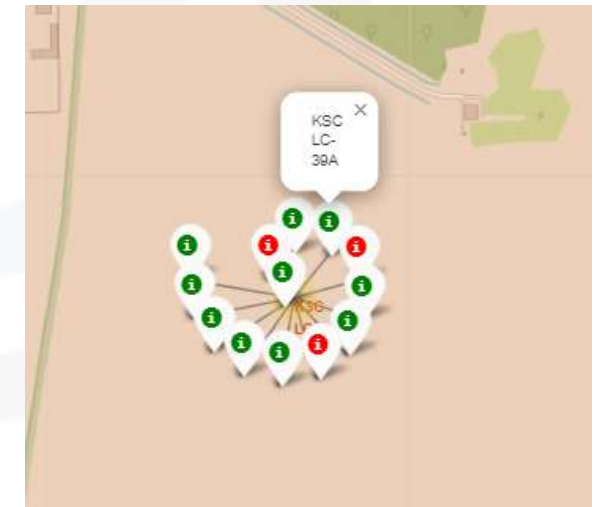

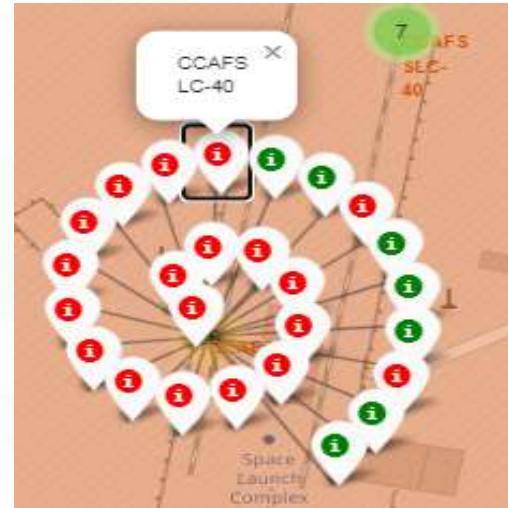

Launch Site	Lat	Long
CCAFS LC-40	28.56230197	-80.57735648
CCAFS SLC-40	28.56319718	-80.57682003
KSC LC-39A	28.57325457	-80.64689529
VAFB SLC-4E	34.63283416	-120.6107455

# Display Launch Outcome by Color

From the color labels, we can easily see

- KSC LC-39A has a rather higher success rate
- Whereas CCAFS LC-40 and CCAFS SLC-40 have much lower rate

# Display Launch Outcome by Color

- ❖ The distance from KSC LC-39A to the nearest shuttle landing facility is about 4.16 km.
- ❖ The distance from KSC LC-39A to the nearest highway is less than 1 km.
- ❖ The distance from KSC LC-39A to the coastline is around 6.5 km.
- ❖ The distance from KSC LC-39A to the nearest city is around 16 km.

# BUILD DASHBOARD WITH PLOTLY DASH

# Total Success Launches for All Sites

Total Success Launches for All Sites is

- CCAFS LC-40: 29.2%
- VAFB SLC-4E: 16.7%
- KSC LC-39A: 41.7%
- CCAFS SLC-40: 12.5%

## SpaceX Launch Records Dashboard

All Sites

Total Success Launches by Site

# Success Ratio for KSC LC-39A

The launch site with highest launch success ratio is **KSC LC-39A**.

It has a success rate of **76.9%**.

## SpaceX Launch Records Dashboard

KSC LC-39A

Total Success Launches for KSC LC-39A

# Correlation Between Payload and Success

- ☐ Payload range in [3000, 4000] has the largest success rate.
- ☐ Booster version of **FT** has the largest success rate.

# PREDICTIVE ANALYSIS CLASSIFICATION

# Classification Accuracy

- ❑ **Decision Tree model** has the highest classification accuracy
- ❑ training accuracy 0.86 and **testing accuracy 0. 0.94**
- ❑ Parameter: {'criterion': 'entropy', 'max\_depth': 10, 'max\_features': 'sqrt', 'min\_samples\_leaf': 4, 'min\_samples\_split': 5, 'splitter': 'random'}

# Confusion Matrix

- ❑ Decision Tree model can distinguish between the different classes.
- ❑ The major problem is **False Positives**.

# Conclusions

---

- The dataset comprises **90 rows** and **83 columns**. Through an 80/20 split, we allocated 72 rows for training and 18 for testing purposes.
- Employing **GridSearchCV**, we trained four models, all exhibiting optimal performance on the test dataset.
- From these models, our top choice for predicting rocket landing outcomes is the **Decision Tree model**.
- However, utilising the decision tree may introduce concerns regarding **false positives**, potentially impacting our accuracy in estimating future bids for rocket launches.

# Challenges in Model Training

- ❑ The dataset comprises 90 rows but contains 83 columns.
- ❑ With an 80/20 split, our training set consists of only 72 records for training.
- ❑ The imbalance of **more features than samples** raises concerns about **overfitting** during model training.
- ❑ Additionally, we only have 18 test samples. Too few to find out problems.

	FlightNumber	PayloadMass	Flights	Block	ReusedCount	Orbit_ES-L1	O
0	1.0	6104.959412	1.0	1.0	0.0	0.0	
1	2.0	525.000000	1.0	1.0	0.0	0.0	
2	3.0	677.000000	1.0	1.0	0.0	0.0	
3	4.0	500.000000	1.0	1.0	0.0	0.0	
4	5.0	3170.000000	1.0	1.0	0.0	0.0

87	88.0	15400.000000	6.0	5.0	5.0	0.0	
88	89.0	15400.000000	3.0	5.0	2.0	0.0	
89	90.0	3681.000000	1.0	5.0	0.0	0.0	

90 rows × 83 columns

# Challenges in Model Training

- ❑ How to handle this issue?

- ❑ Obtain additional data, apply regularization, or employ dimension reduction techniques.

- ❑ **Consider** removing irrelevant columns based on identified **correlations** during EDA.

- ❑ Experiment with **PCA** to reduce dimensions efficiently.

	FlightNumber	PayloadMass	Flights	Block	ReusedCount	Orbit_ES-L1	O
0	1.0	6104.959412	1.0	1.0	0.0	0.0	
1	2.0	525.000000	1.0	1.0	0.0	0.0	
2	3.0	677.000000	1.0	1.0	0.0	0.0	
3	4.0	500.000000	1.0	1.0	0.0	0.0	
4	5.0	3170.000000	1.0	1.0	0.0	0.0	
...	...	...	...	...	...	...
